Omniq is an Integrated Mobility Platform that combines public transit and intercity services into a multimodal travel planning solution. It enables operators to deliver first-class Mobility-as-a-Service by providing trip planning, reservation, and ticketing services for multiple modes of transportation in a single back-end server and front-end application.

Key features

First and last-mile capabilities, combining local transit with intercity travel services

Commerce capabilities for extra services: ancillaries, accommodation at destination, car/bike renting

Journey planner solution based on OTP/OSM, or integrated with existing Journey Planner Systems to automate manual connection-building processes

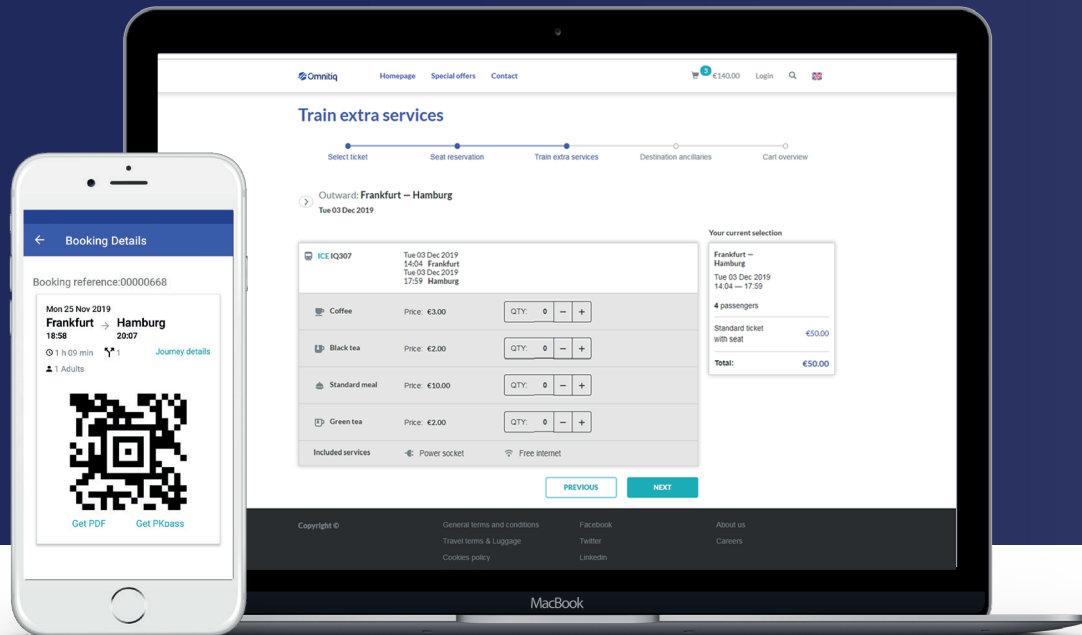

Timetable data hosting with real-time operating status and capabilities to ingest data from various sources

Integration of existing legacy reservation and ticketing systems with other forms of travel

Unified payment and single electronic document for all journey segments, providing ticketing for the services of all involved transportation partners

How you will benefit

Passengers

Door-to-door journey experience, rather than station to station

Consolidated customer experience for planning, reservation, and payment across multiple touchpoints

Easy access to multiple transportation options and additional services: ancillaries, accommodation at the destination, car/bike renting

Reduced uncertainty about pricing, reservation, ticketing and connectivity between transportation modes

Operations

Ridership and revenue growth, strengthening public transport competitive position

Reduced costs for public transportation services through simplification and the adoption of global standards and practices

Simplified and cost-effective travel for all communities

Leverage global business model, reduce costs for transit operators and authorities, increase social inclusion
